

Assignment 1

SPSS For Research

Instructor: Md. Ahsanul Islam

Deadline: 25 July 2026

Every cleaning and analysis step below must be reproducible. Instead of clicking OK in each dialog, click PASTE to send the command to a syntax window. Save the syntax file as **assignment1_syntax_YOURNAME.sps**.

Task 1:

Download the file from the following link - [CTRL + Click to follow link to download page](#)

Import the file into SPSS using File > Import Data. Tick “First line contains variable names”. Check that all 13 variables imported correctly and that no column was read as the wrong type.

Task 2: Save the data

Save the imported data as **assignment1_data_YOURNAME.sav** (for example, assignment1_data_Rifat.sav). Use this same file for every task below.

Task 3:

In Variable View, define each variable exactly as given in the table below.

Variable	Variable Label	Value Labels	Measure
student_id	Student identification number		Nominal
gender	Gender of respondent	1 = Male; 2 = Female	Nominal
faculty	Faculty of enrolment	1 = Science; 2 = Business; 3 = Arts; 4 = Engineering	Nominal
year_of_study	Current academic year		Scale
study_hours_week	Self-reported study hours per week		Scale
sleep_hours	Average hours of sleep per night		Scale

Variable	Variable Label	Value Labels	Measure
attendance_pct	Class attendance (percentage)		Scale
stress1	I feel overwhelmed by coursework	1 = Strongly disagree; 2 = Disagree; 3 = Neutral; 4 = Agree; 5 = Strongly agree	Ordinal
stress2	I worry about exams	Same 5-point scale as stress1	Ordinal
stress3	I find it hard to relax	Same 5-point scale as stress1	Ordinal
stress4	I feel tense about deadlines	Same 5-point scale as stress1	Ordinal
stress5_calm	I feel calm and in control (REVERSE-WORDED)	Same 5-point scale as stress1	Ordinal
gpa	Grade point average (0.00 - 4.00)		Scale

You can use Data > Define Variable Properties to add value labels.

Task 3:

The gender column has been entered inconsistently - you will find Male, male, M and 1 all meaning the same thing (and Female, female, F, 2 for the other). Recode gender into a single consistent numeric variable (1 = Male, 2 = Female). Run a frequency table to confirm only two categories remain.

Task 4:

sleep_hours contains some values of 99. This is a missing-data code, not 99 hours of sleep.
attendance_pct contains some values of 250. Attendance is a percentage, so this is an impossible data-entry error.

Similar to above two points, check summaries of all the variables to check for any anomalies / missing observations. Declare these as missing.

Several variables also contain blank cells - leave these as system-missing.

Task 5:

The file contains a few duplicate records. Find them matching on `student_id`. Remove the duplicates and state how many cases remain in the dataset.

Task 6:

`stress5_calm` (“I feel calm and in control”) is worded in the opposite direction to the other four items - a high score means LOW stress. Create a new variable `stress5_r`, where $\text{stress5_r} = 6 - \text{stress5_calm}$.

Then compute a total stress score: $\text{stress_total} = \text{stress1} + \text{stress2} + \text{stress3} + \text{stress4} + \text{stress5_r}$.

Task 7:

Check summary (minimum, maximum, range, mean, and median) and histogram for `study_hours_week`, `sleep_hours`, `attendance_pct` using “Frequencies” dialogue box.

Task 8:

Check frequency table and bar chart for `faculty` and `year_of_study` using “Frequencies” dialogue box.

Task 9:

Export the output to doc file and save as `assignment1_output_YOURNAME.doc`.

Submission:

Submit a zip file containing (1) the exported doc file of the output window, (2) saved dataset, and (3) `syntax file` in google classroom. Make sure your exported document does not contain anything extra other than very required things that someone would be interested to see to inspect the data quality.

Before submitting the doc file, remember to open and write your name at the beginning of the output.

****Pease write your name as per the certificate****
